

Green Eye

VISUAL TERMITE DETECTION

Walk past, look for the color change.

A tripped alert equals a termite job.

Destroyed CTA is proof for the customer.

GREEN EYE Visual Alerts have the best features on the market.

The Green Eye Alert is a gravity activated termite alert that eliminates the need to bend over and remove a block of wood to detect the presence of termites.

The CTA is the work horse behind the entire Green Eye Product line. The green on top of the alert will disappear as termites attack the alert and consume the food source, this works using gravity. The green weight is supported by the food source, as the color falls away this gives the appearance that the color has disappeared.

Using the CTA you can retro fit any bait station on the market to visual detection, by drilling a 11/16" hole in the top cap. Ensuring that the wood plug is making contact with the dirt you have created the best termite detection device on the market. The CTA can also be inserted through concrete to protect a structure surrounded by concrete.

The MTA is our termite station, holding the CTA in the center; all the features listed above are in the MTA along with dual treatment ports. Applying a good treatment to the termite colony without disturbing them and redirecting the tunnels is important to a good solution to the problem. The MTA allows a non-detectable termiticide to be applied thru the treatment ports without disturbing the food source of the termites.

The ITA or inside termite alert is a interior termite detection device that functions exactly as the CTA only it has been engineered to work 90 degrees for mounting into interior walls with 2x4 and drywall construction. This device can be retrofitted into existing homes or for new construction.

GREEN EYE Visual Alerts will increase the number of units monitored.

- Utilizing our visual alert will reduce monitoring time.
- Visual alert reduces fatigue during inspections. NO bending over to inspect.
- Visual alert is a sealed, gravity activated detection, ensuring accuracy.

GREEN EYE uses the most advanced termiticides.

- Wood to ground contact allows the use of the most advanced termiticides.
- Inspection and treatment ports eliminate the need to move food source.

GREEN EYE gives your clients peace of mind.

- Visual alert allows a home or business owner to contact authorized treatment professional before a scheduled inspection.
- Visual alert provides peace of mind for the home or business owner by ensuring no pests are detected.

GREEN EYE Visual Alerts

All Models Feature

- Visual Termite Detection
- Pure cellulose with wood to ground contact, wax coated for extend life in the ground.

Model MTA

Features

- Monitoring Termite Alert
- Visual Termite Detection
- Large amount of cellulose for termites to eat.
- Dual treatment / Inspection ports

Model ITA

Features

- Inside Termite Alert
- Visual termite detection
- Unit is mounted to the wall and makes contact to the sill plate, for interior termite monitoring.

Model CTA

Features

- Center Termite Alert
- Visual termite Detection
- Retro fit any bait station to visual detection.
- Drill a 11/16" hole through plastic
- Drill 5/8" hole through concrete
