

Thank you for purchasing the green eye alert.

ITA

Inside Termite Alert

How the ITA works, the ITA has cellulose tentacles that reach out and contact the sill plate, gypsum board, studs and termites.

Once termites discover the ITA tentacles they will travel up into the alert and consume the cellulose. This activates the trigger, setting off the alert, changing the color, and alerting the home owner.

Termites will move freely in a wall, because it is a controlled environment.

Termites are simple creatures and finding them should be too.

Installing the ITA, tools that you will need.

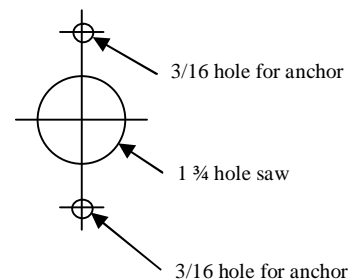

- Drill
- 1 3/4 hole saw
- 3/16 drill bit
- Flat screw driver

Watch an installation video on our web site. (Videos, ITA install video)

Using the wall plate as a template, mark the center locations of the three holes.

Drill the center hole using the 1 3/4 hole saw.

Drill the mounting holes for the anchors using the 3/16 drill bit.

Assemble the wall plate to the green eye, slide the green eye through the hole in the wall plate and press until it snaps into place.

Press the anchors into the holes in the wall.

Insert the assembled ITA through the 1 3/4 hole in the wall and secure into place using the flat head screws.

Monitor the ITA, as you move around the home. NO need to remove the ITA until termites attack and an alert is detected. If an alert is attacked you must contact your pest control professional for treatment.
