

Thank you for purchasing the green eye alert.

## MTA

### Monitor Termite Alert

**How the MTA works**, the MTA has a wax rolled cellulose food source. This material is the initial food source. The CTA (Center termite Alert) is the color changing center that you see as the green eye. This food source is sealed from the environment and will last in the ground; it is also changeable after an attack.

Once termites discover the MTA they will travel up into the alert and consume the cellulose. This activates the trigger, setting off the alert, changing the color, and alerting the home owner.

Termites are simple creatures and finding them should be too.

**Installing the MTA**, tools that you will need. Shovel or (Auger bit)

The center or CTA is shipped out of the MTA this reduces damage during shipment. To install simply insert the CTA in the top of the MTA and press in.

The CTA is a sensitive item, think of it like a mouse trap if you impact it hard it will set off. During handling, dropping or impacting the ends could cause the color to start to slip down.

If the color weight is down 1/8" or less this is an acceptable part.

See installation pictures on our web site. (Products, MTA, installation pictures) Bury these units flush to the top of the soil. Set these stations around the structure you wish to protect about 2 feet from edge and 10 feet apart.

**Monitor the MTA**, as you move around the home. NO need to remove the MTA's center until termites attack and an alert is detected. If an alert is attacked the home owner must contact their pest control professional for treatment.

**Treatment:** The Green Eye Alert is a green product, your customers will feel better knowing your not over applying chemicals around the perimeter of their home. We recommend with the Green Eye Alert that you watch for a termite attack, then treat with a non-detectable 10 feet on each side of the attacked alert. Replace the CTA and watch for future activity, however treatment options are completely up to you.
